Subject: RE: Somerset Magnetometer Survey

⚠ CAUTION: This email originated from an external sender. Verify the source before opening links or attachments. ⚠

Hi Pat,

Our scope of work did not include time to investigate all anomalies on the project site. When we scoped the original project we discussed this item and the guidance we received was to complete the following.

Our team placed known anomalies on the project site prior to data collection. The known anomalies were used to verify the magnetometer was operating properly. After data collection was completed for the project site our field team checked the larger anomalies and they were all identified as trash items on the project site. Based on the field verification work that was completed the geophysicist that we worked with us on the project reviewed the data that was collected and determine that the anomalies on the site were not representative of oil infrastructure.

Does this information help you for your submittal?

Thank You
Steve

Subject: RE: Somerset Magnetometer Survey

Importance: High

Hi Steven, this is the last component we need from you to complete our deficiency response. Can you please have a response by Friday, 7/28?

Comment	Appendix 3-C: Magnetometer Survey, states that 66 anomalies had no surface expression and were not investigated further. Please provide a complete record of the initial investigation of these anomalies or provide analysis by a qualified expert with supporting information explaining why the un-surveyed anomalies do not represent NYSDEC regulated wells.

Hi Steve,

Happy Monday. We looked through all the data you have shared and I think we just need a little more information to satisfy all of the comments we received from ORES. Can you please provide a response to the comment below? ORES specifically requested that a qualified expert provide the rationale relating to the response. If you are referring the reader to anything in the report (that ORES may have missed), please identify the section/page of the reference so we can make sure we're 100% clear for ORES.

Comment	Appendix 3-C: Magnetometer Survey, states that 66 anomalies had no surface expression and were not investigated further. Please provide a complete record of the initial investigation of these anomalies or provide analysis by a qualified expert with supporting information explaining why the un-surveyed anomalies do not represent NYSDEC regulated wells.
Response	

Please let me know of your timeline for this response and if you have any questions. Linda Rivard of Tetra Tech (cc'd) is coordinating the response package and can weigh in here as well.

Thanks Steven, I think this is what we're looking for. However, do you have it in a shapefile?

We might reach out to get some verifications and maybe some explanation of methodology in the next couple weeks.

I think this is a good start, but we will need the trajectory lines too. Once we have that, then maybe we can get a little more color about the meaning of the figure so we can address the agency clearly. They ask some relatively in depth questions regarding the survey.

Can you tell me how long it will take to get the flight lines?

Hi Pat,

Sorry we are trying to get the trajectory lines from our flight logs still. The UAV that we used for this project is no longer being utilized so we have to go back to an old software to process the trajectory lines.

In the meantime would the agency accept the attached? The attached shows the extents of the mapping that was completed. This shows the 500ft area was included and analyzed in the final report.

Thank You
Steve

Hi Pat,

I'll work with our team on Thursday to get this wrapped up. The flight lines are one source of information. But with anomalies this large that were being searched for you don't need to fly the UAV along the 500ft buffer to accurately map the area inside the 500ft buffered area.

We can provide the flight lines and also a letter explaining the mapping methodology more to help them understand what was completed.

Hi Ryan and Steven,

Hope you had a nice holiday. I'd like to push on this a little bit because we met with ORES today and they did in fact say the magnetometer survey did not meet requirements under 94c, so we really need the flight lines as well.

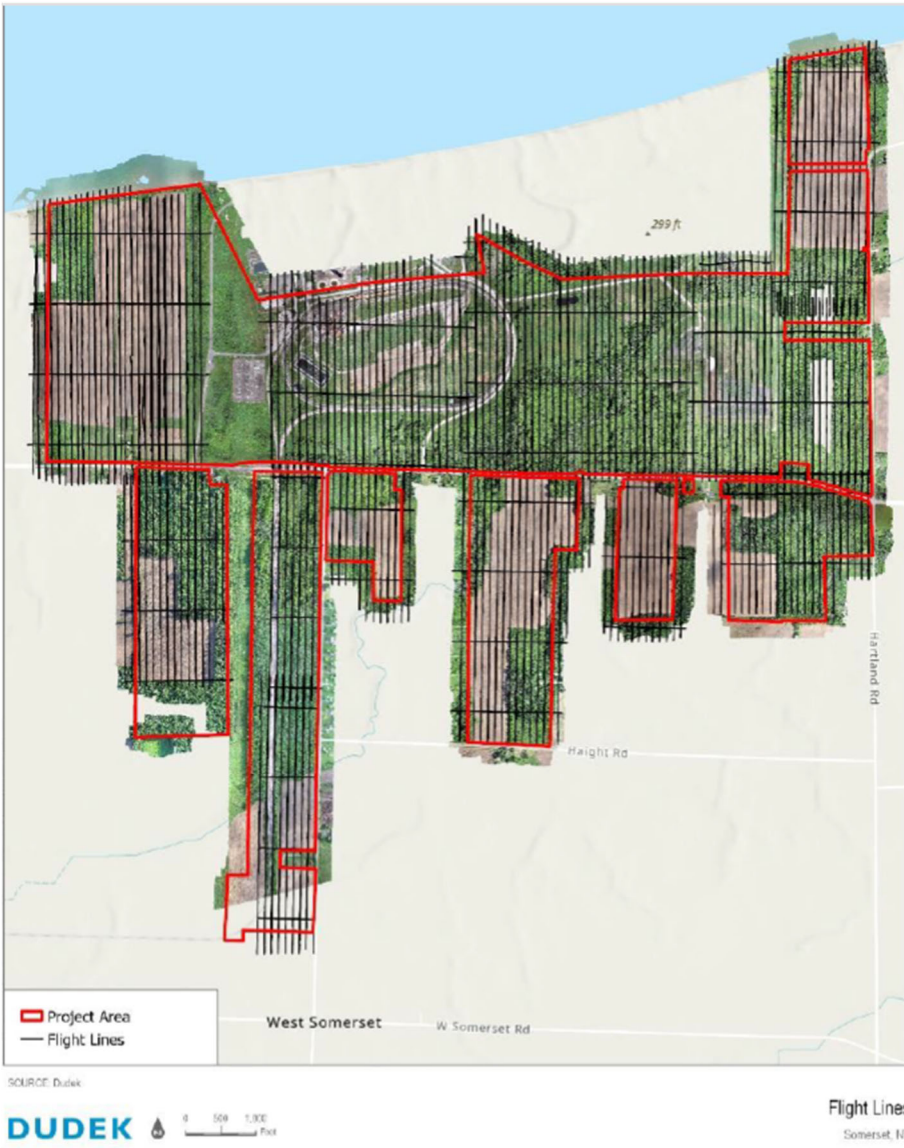

Please let me know what timeline this request is on.

Hi Steven,

It seems like Peggy has had some trouble reaching you the last couple weeks. We absolutely need shapefiles of the limits flown for the magnetometer studies to verify that we met ORES requirements. Both ORES and our team has suspicions that we have a data gap that we need to address. Our response is constrained by regulatory timelines and this data is crucial to finishing our response to comments.

Please provide a status of fulfilling the request. Thank you.

Subject: Somerset Magnetometer Survey

Good afternoon Steven,

In March of 2022, Dudek had conducted the magnetometer survey for the AES Somerset Solar Project (you had previously coordinated with Jack Donelan regarding this). We've submitted the application to the Office of Renewable Energy Siting and they've inquired about the extent of the magnetometer survey. Could you please review the flights flown for the Somerset Solar Project Magnetometer Survey and verify they included the 500' buffer as required per 19 NYCRR § 900-2.4(u)(1)? Additionally, could you please send me SHP files of the flights flown?

If you have any questions, please feel free to e-mail or call me at the mobile number indicated below.

Thank you,
Peggy

1 Overview

1.1 Project Description

Dudek was contracted by AES Clean Energy Development to acquire, process, and deliver magnetometer data and derivative products for a project in Northwest New York, with emphasis on identifying potential abandoned oil and gas wells. The project areas cover approximately 1,400 acres (ac), divided into 9 subsections of Somerset, New York.

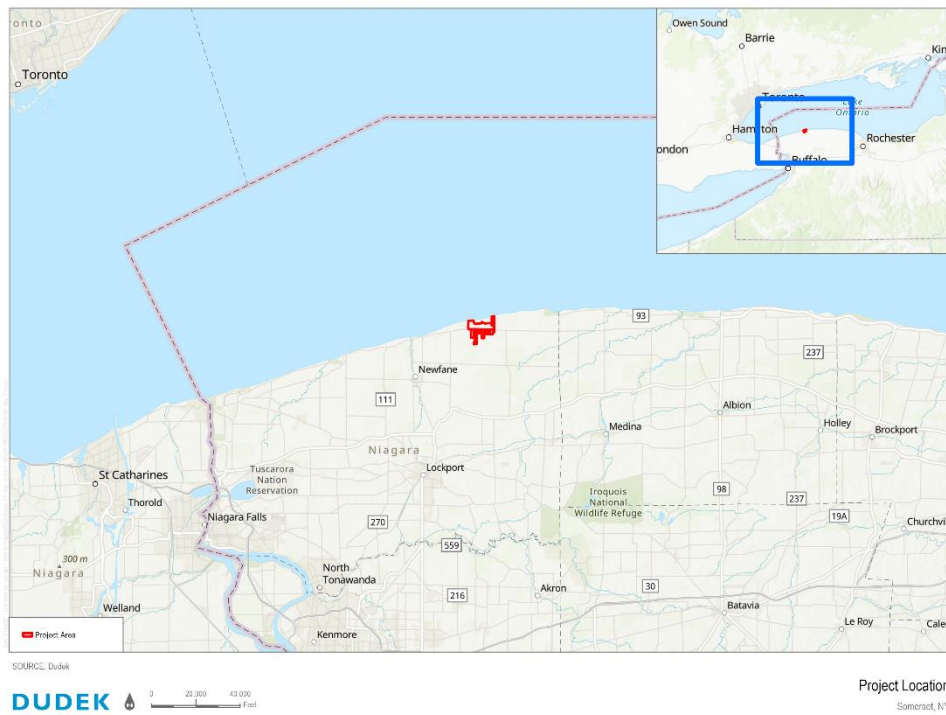

Figure 1- Project Location

Figure 2 - Project Area

2 Magnetic Data Acquisition Methodology

Magnetometer acquisition for the 9 sub-areas at Somerset was performed from June 15 – June 25, 2022 totaling 83 discrete flights. The survey utilized a Geometrics MagArrow Magnetometer suspended from a DJI Matrice 600 Pro drone. Dudek flew at an altitude of 100 ft above ground level (AGL) using terrain following software to maintain consistent altitude. Flight surveys were flown at a speed of 10 mph with 100 ft horizontal distance between flight lines.

2.1 Magnetometer Acquisition Equipment

DJI Matrice 600 Pro

The Matrice 600 Pro (M600 Pro) is a six propped rotary-wing drone built with a modular design for payloads up to 6 kg (13.2 lbs). Unlike the smaller DJI drones, the M600 Pro does not come with any built-in sensors. Instead, this drone is truly for commercial uses and can haul any number of sensors. With all six batteries and no payload the M600 Pro has a max flight time of 32 minutes and with the max 6kg payload it has a flight time of 16 minutes.

The M600 Pro comes with preinstalled arms and antennae that fold down for easy transportation. This allows the field crews to quickly set up, take down, and move take off locations without wasting valuable field time disconnecting and re-connecting various components.

To help ensure safety in the field the M600 Pro comes standard with multiple safety systems. Foremost, the A3 Pro Flight Controller has triple modular redundancy, diagnostic algorithms that compare sensor data from three sets of GNSS units, and analytical redundancies to guarantee the drone flies where programmed to. Additionally, the propulsion system is actively cooled and has a dust proof seal resulting in less maintenance and ensures reliable operation for an extended period. Finally, the battery management system monitors all six batteries during flight to ensure a safe landing in the event of single battery failure.

Exhibit A. DJI M600 Pro shown with MagArrow payload.

Source: Dudek 2021

Geometrics MagArrow Magnetometer

The MagArrow is a lightweight airborne magnetometer developed by Geometrics and designed specifically for use with unmanned aircraft systems (UAS). The scanner is a user-friendly and cost-efficient device used to acquire magnetic data by use of remotely piloted multi-rotor UAS for a variety of applications.

Table 2. MagArrow Specifications

Scanner Attribute	Specification
Operating Principle	Laser pumped cesium vapor (Cs133 non-radioactive) total field scalar magnetometer.
Operating Range	20,000 to 100,000 nT
Gradient Tolerance	10,000nT/m
Sampling Rate	1000 Hz. synchronized to GPS 1PPS

Table 2. MagArrow Specifications

Scanner Attribute	Specification
Bandwidth	400 Hz
GPS	Commercial grade with typical 1 m accuracy
IMU	Bosch BMI160 Accel/Gyro - 200 Hz sample rate. Insentek Compass - 100 Hz Sample rate

Source: Geometrics 2022

Geometrics G-857 base station Magnetometer

A Geometrics G-857 base station magnetometer was set up each day at least 30 min prior to surveying to record the diurnal variations of the Earth’s magnetic field. The base station was automatically time synchronized to UTC time using as integrated GPS. The base station collected data at a rate of one reading every 1 seconds.

3 Post-Processing

3.1 MagArrow Data

For each mission, raw data files were batch processed into a single comma-delimited file (CSV) using Geometrics Survey Manager software. The exported CSV files are plotted using Geosoft Oasis Montaj and ESRI ArcGIS Pro and clipped to eliminate any non-flight line data and grouped into individual flight lines for further processing. Using Oasis Montaj software and the G857 base data, data was corrected for diurnal variations throughout the day of acquisition. Finally tie line leveling is performed to combine multiple days of acquisition. With final magnetic values, data is ready for interpolation and analysis.

3.2 Gridding and Analysis

The processed magnetic data values are then interpolated into raster “grids” to visual the magnetometer readings across the entire project site. Using Oasis Montaj generate Total Magnetic Intensity (TMI) maps and Analytic Signal Maps to identify areas of elevated magnetic readings. Total Magnetic Intensity best reflects the real-world magnetic field without major geologic trends. This data is shown in nT (nanotesla) and both negative and positive anomalies are visible.

Analytic Signal is a filter applied TMI data and helps better delineate the boundaries of the anomaly. This is calculated by the square root of the squared sum of the vertical and two horizontal derivatives of the magnetic field resulting in units of nT/meter (nanotesla per meter). From the analytic signal grid, “peaks” are then identified using software. These points indicate spot locations of elevated magnetism. Recently collected orthoimagery as well as field inspection are then used to investigate the sources of those anomalies.

4 Results

4.1 Total Field Intensity

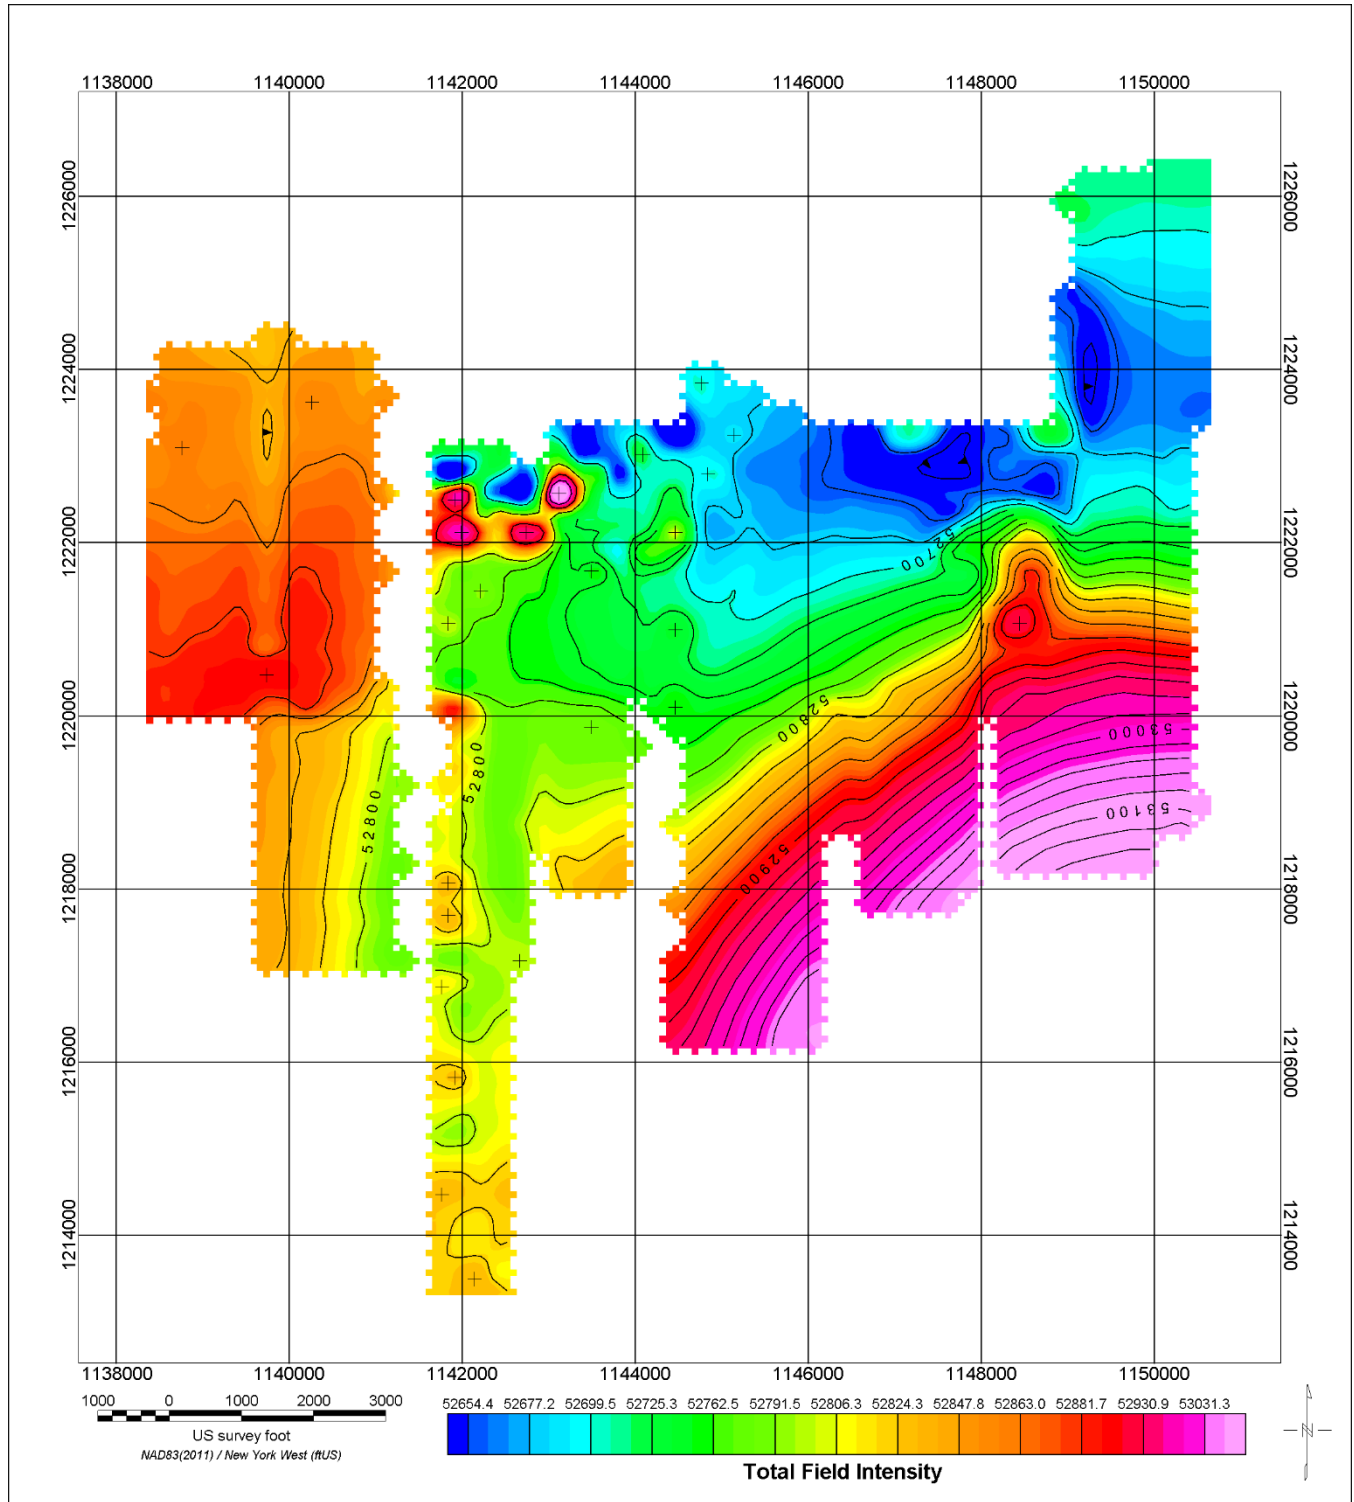

Figure 4 - Field Intensity Map

4.2 Analytic Signal Map

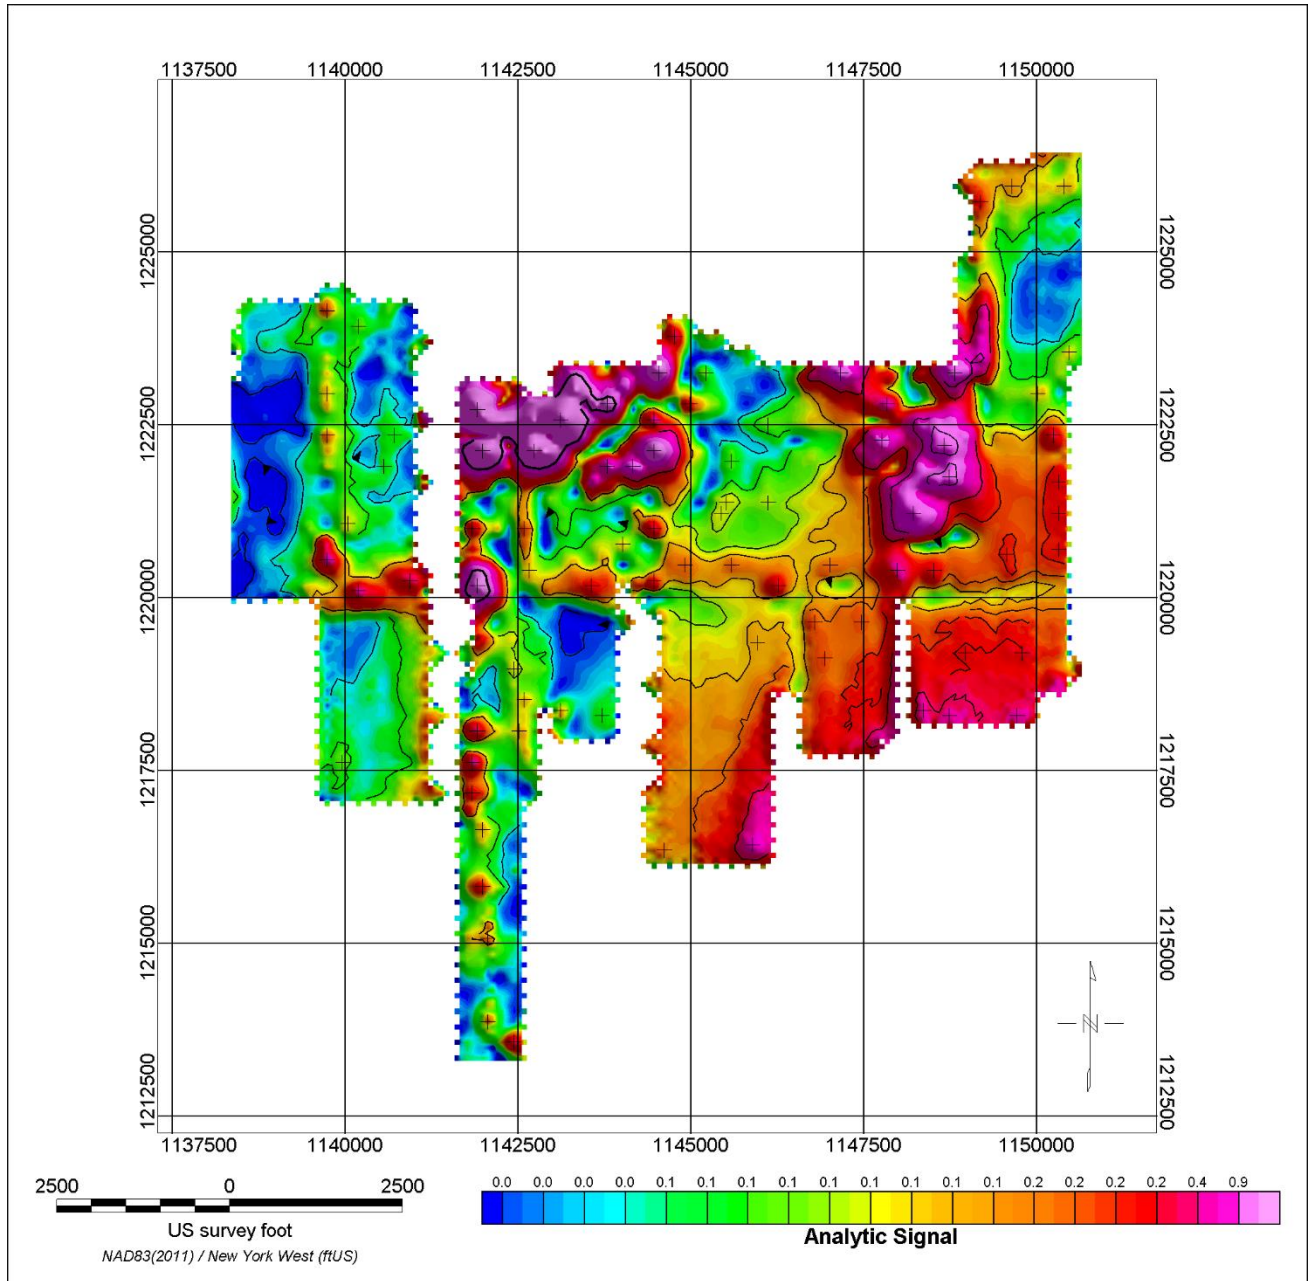

Figure 5 - Analytic Signal Map

4.3 Anomaly Inspection

There were initially **192** anomaly peaks identified in the analytic signal grid data. Using UAV aerial orthoimagery, UAV oblique imagery and ground level field photos Dudek collected in June 2022, Dudek deemed **108** of those **192** points as unnecessary to investigate further due to surface evidence such as telephone poles, overhead electrical utilities, street lights, train infrastructure and general debris. The remaining **84** signals were investigated in person by a Dudek surveyor equipped with NTRIP enabled survey GNSS rover (See Appendix A for surveyed coordinates for each)

Of those **84** points, **66** had no surface evidence of the source of the anomaly (shown in Red on figure 5). The remaining **18** locations that did have surface evidence are shown in blue in figure 5 below. See appendix B for photos for all **84** locations.

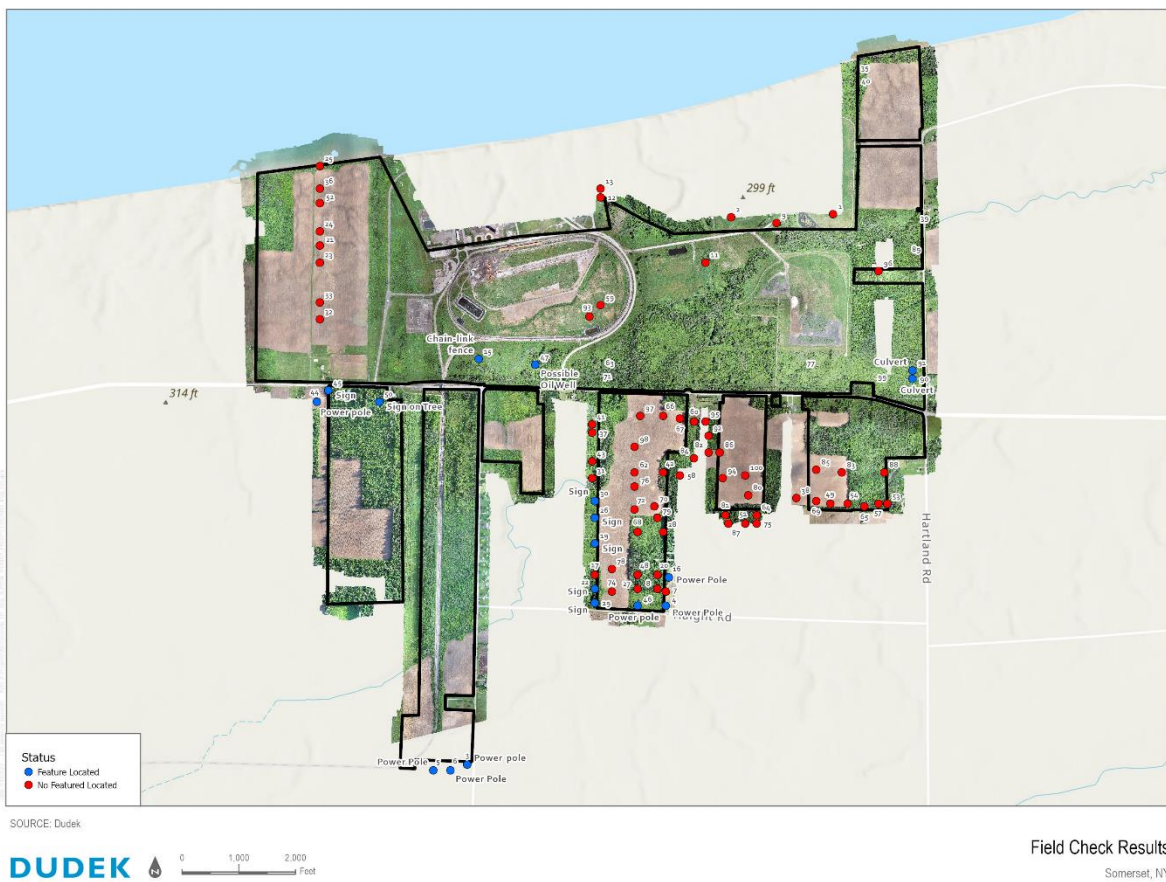

Figure 6 - Field Check Results

Table 1 – Features Identified

Point ID	Northing	Easting	Signal Value	Comments

46	1216392	1145393	0.206372	Power pole
47	1220642	1143593	0.202733	Possible Oil or Water Monitoring Well
50	1219992	1140843	0.20011	Sign on Tree
90	1220392	1150243	0.159757	Culvert
91	1220542	1150243	0.159584	Culvert

As indicated above, Point 47 is the only anomaly that Dudek located that requires additional follow up. (See figures 6 and 7). Point 47 appears to be vertical metal pipe with a latching cover and a pad lock. Adjacent are two bollard posts. This feature is approximately 10 feet south west of a rectangular structure, possibly an old storage container.
