## 1.0 Introduction

On behalf of AES Clean Energy, TRC Companies has performed an engineering assessment of the Electric and Magnetic Fields (EMF) associated with Brookside Solar Project (the Facility). The proposed configuration will consist of the Facilities collection substation directly adjacent to a three breaker ring bus substation to be owned by NYSEG. This NYSEG station will have a loop in and loop out connection to the existing NYSEG Line 911 Willis Rd to Chateaugay 115kV transmission line. (See Figure 1)

The collection station is connected to the proposed NYSEG station by a short section of strain bus of less than 100ft in length. This connection is fully contained within the collection and NYSEG substation fences, so no EMF studies were performed on this connection. This study was performed on the loop in and loop out connections between the proposed NYSEG substation and the existing Line 911. No EMF calculations were performed on the 34.5 kV collection system.

The proposed interconnection consists of two runs of 336.4 kcmil 30/7 Aluminum Conductor Steel Reinforced (ACSR) "Oriole" conductors that will run approximately 173 ft and 210 ft from the takeoff structures in the NYSEG substation respectively to structures 103 and 104 that will be replaced as part of this project.

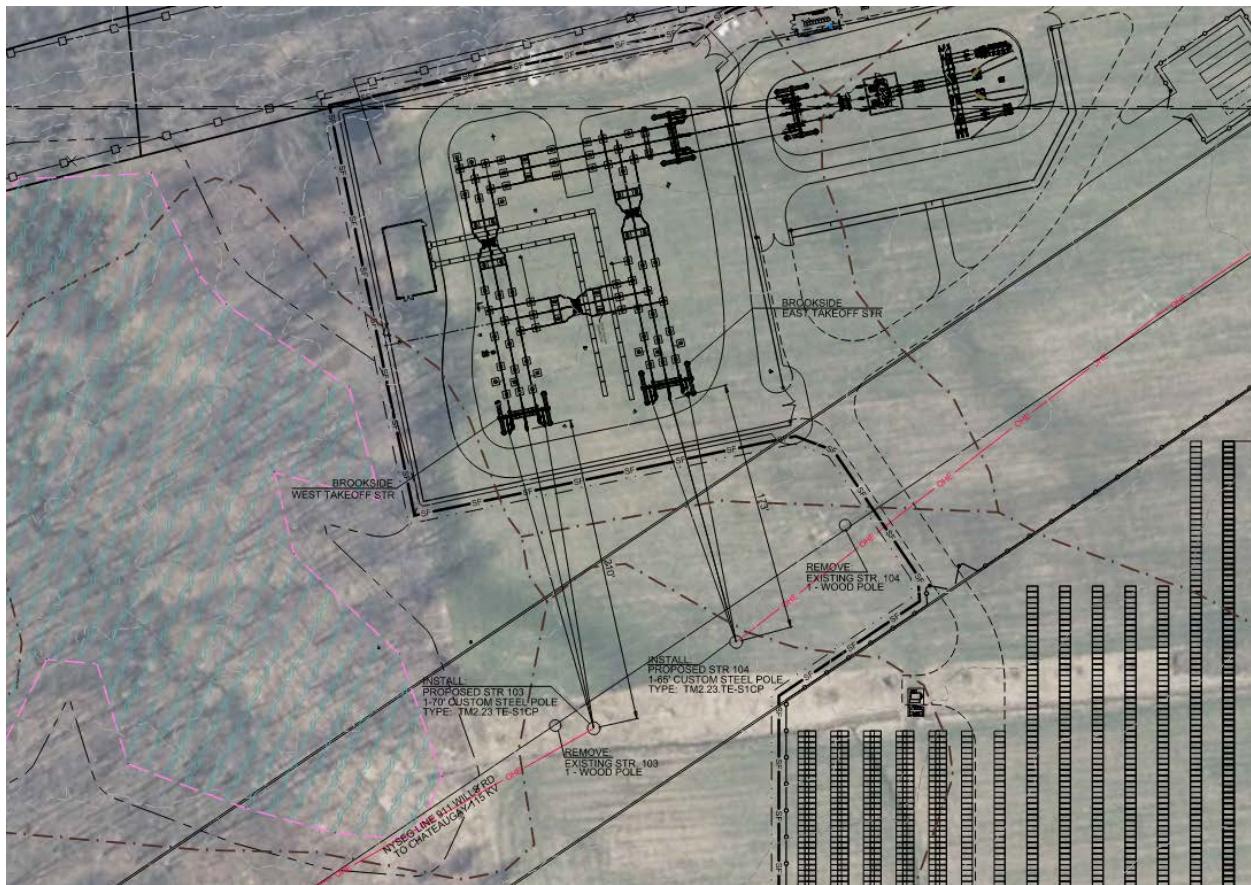

Figure 1: Interconnection Aerial Imagery

This study evaluated the future EMF levels at 60 Hertz power line frequency produced by the proposed loop in and loop out connection. This study summarizes the future, or post-construction, calculated EMF generated from this location.

The pre-construction EMF field generated along this interconnection varies as there is existing EMF generated from the NYSEG Line 911. EMF levels were calculated using the ratings provided by NYSEG in Table 1 for the existing line.

The post-construction EMF levels for the transmission connection were calculated using the geometry at the locations of the proposed replacement structures 103 and 104 as shown in Figure 1 above. The effects of the existing NYSEG Line 911 combined with the new interconnection were not modeled as the orientation of the two lines are approximately 90° apart and the typical EMF modeling programs require the lines to be parallel to model the shared impacts.

The solar panels associated with the Facility will generate Direct Current (DC) power. Multiple solar panels are interconnected and are connected via cables to inverters which convert the DC to Alternating Current (AC) power. There will be inverters centrally located throughout the Facility Site. Transformers associated with the inverters will step up the voltage to 34.5 kV. The output of the inverters and associated transformers will be collected via 34.5 kV underground collection feeders which will connect to the proposed collector substation. The proposed collector substation facility will step up the solar facility voltage from 34.5 kV to 115 kV.

## 2.0 Technical Approach

EMF levels were calculated using Bonneville Power Corona & Field Effects Ver. 3.1 Software. A computer simulation was developed to calculate the pre and post-construction EMF levels at the typical cross-section.

NYSEG provided the existing line ratings for the line 911 Willis-Chateaugay Tap (115 kV). These ratings will be the controlling factors for the proposed loop in loop out as well. The existing average load of the line was not provided by NYSEG. The power output of the solar Facility will be transmitted on the line, but it will not be allowed to operate at current levels above these ratings, therefore these ratings will be applicable for both the existing and proposed line configurations.

*Table 1: Existing and Proposed Line Ratings*

	Summer Normal	Long Term Emergency Summer	Short Term Emergency Summer	Winter Normal
Current Rating (Amps)	680	800	880	870

### 2.1 Transmission Line Connections

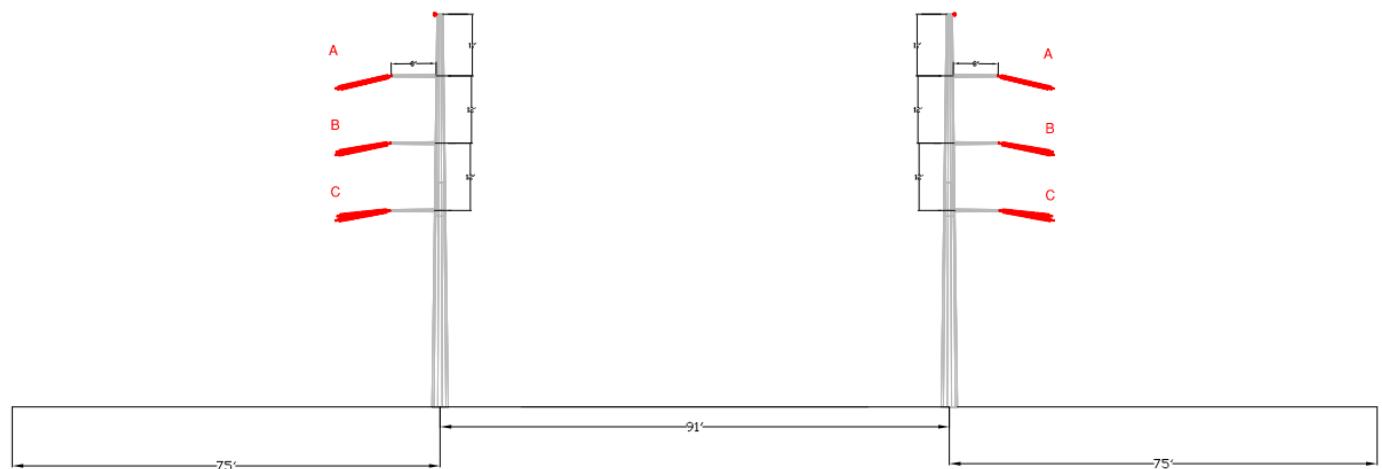

The EMF calculations did not consider any energized sources other than the 3-phase transmission lines. In performing the EMF calculations, the following typical parameters were used:

- Existing and proposed 336.4 kcmil 30/7 ACSR Oriole conductor diameter

- Existing 150' Right-of-Way (ROW) for the existing NYSEG Line 911 and Proposed 241' ROW for the Transmission loop In loop out connection (75' from Centerline of structure to Edge of ROW).
- Phase spacing of the conductors is as shown in Figure 2 and Figure 3 below and the conductor height above finished grade is based on the minimum height of the span at maximum normal operating temperature.
- Operating voltage of the lines with a 5% overvoltage (120.75 kV).
- Current Levels as shown in Table 1.
- Assumed that the existing Line 911 centerline is centered in the NYSEG 150' ROW

*Figure 2: Existing Line 911 Cross Section*

*Figure 3:Transmission Loop in Loop out Cross Section*

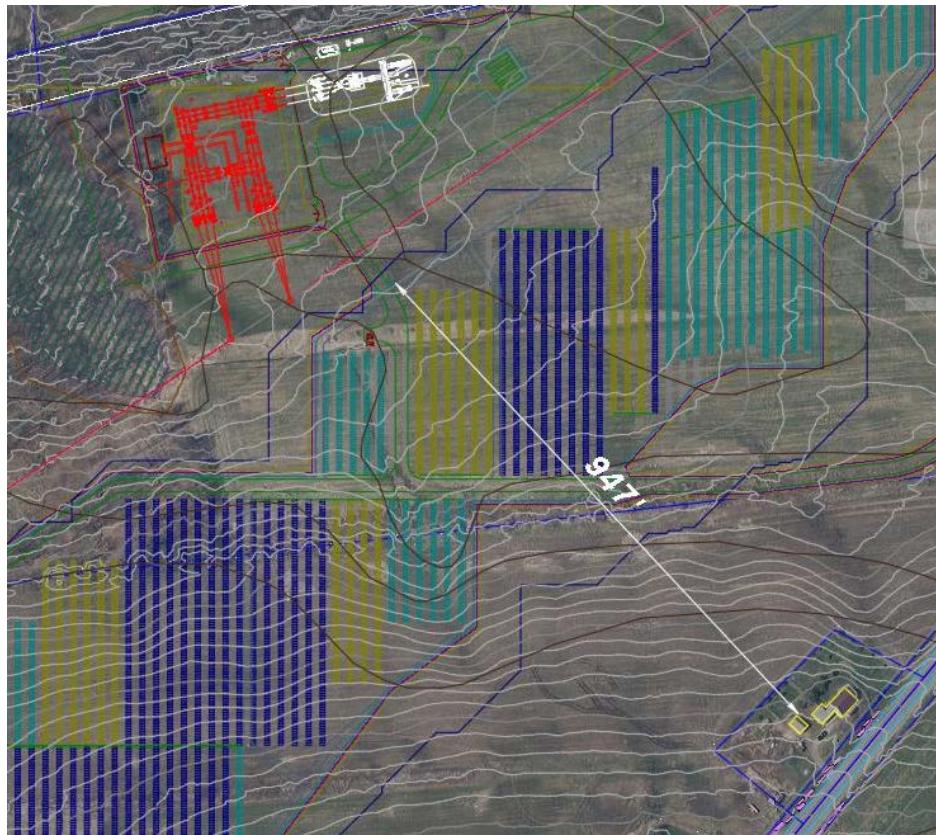

### 3.0 Analytical Results

The following table and figures provide the results of the calculated EMF.

*Table 2: EMF Results*

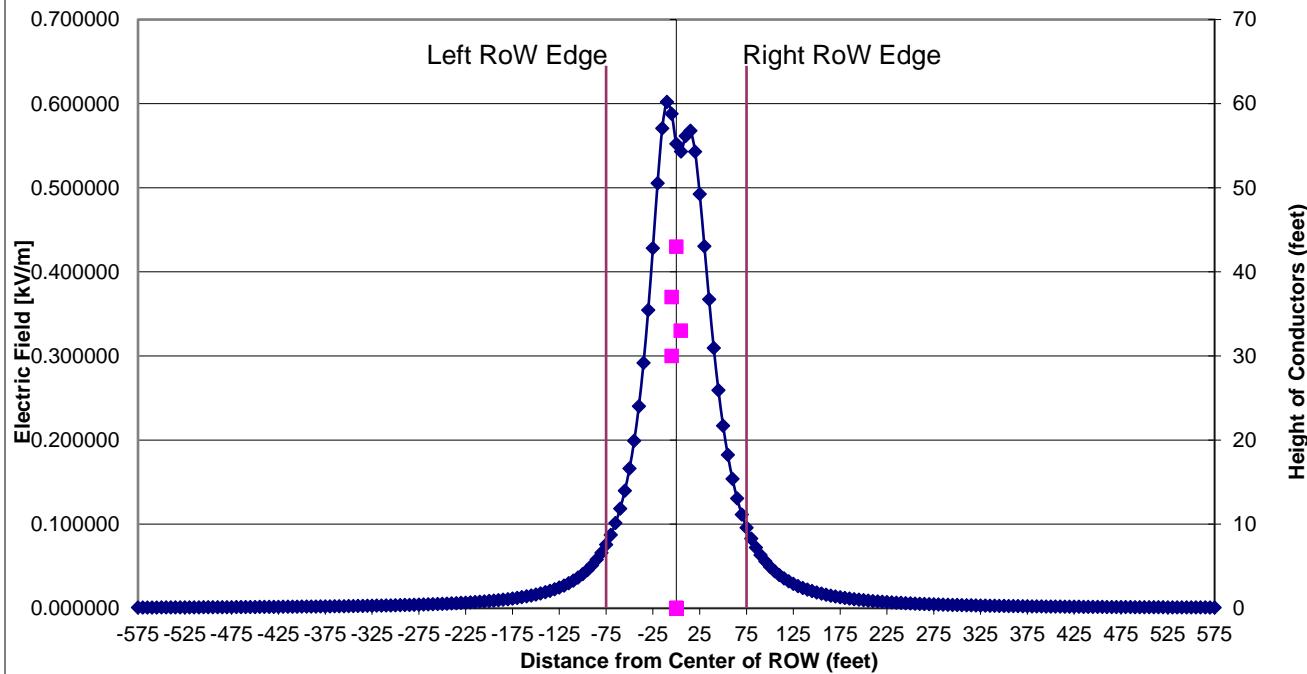

Configuration	Magnetic Field (mG)		Electric Field (kV/m)	
	Max ROW Edge	Max.	Max ROW Edge	Max.
Existing NYSEG Line 911 (SN)	6.78	49.31	0.096	0.6
Existing NYSEG Line 911 (LTE-S)	7.98	58.02		
Existing NYSEG Line 911 (STE-S)	8.77	63.82		
Existing NYSEG Line 911 (WN)	8.67	63.09		
Proposed Loop In Loop Out Connection (SN)	12.32	75.04	0.030	1.1
Proposed Loop In Loop Out Connection (LTE-S)	14.49	88.28		
Proposed Loop In Loop Out Connection (STE-S)	15.94	97.11		
Proposed Loop In Loop Out Connection (WN)	15.76	96.01		

A review of the Facility Site has shown that the nearest residence to the transmission interconnection is located 947 feet away. As shown in the following figures and the tables in Appendix A, the electric and magnetic fields beyond 500 feet are asymptotically approaching zero.

---

## 4.0 Conclusions

The maximum calculated electric field level for the existing NYSEG Line 911 Willis Rd to Chateaugay 115kV transmission line is 0.6 kV/m located 10 ft from the centerline of the existing ROW. The maximum calculated electric field level at the edge of the existing ROW is 0.096 kV/m. The maximum calculated electric field level on the proposed loop in loop out transmission connection is 1.1 kV/m located 50 ft from the centerline. The study reveals that the calculated electric field levels at the edge of the proposed right-of-way, located 120.5 feet from the centerline, is 0.030 kV/m and is less than the 1.6 kV/m maximum electric field level permitted at the edge of a transmission right-of-way in New York occupied by a major transmission line per the New York State Public Service Commission (NYS PSC) Interim Guideline.

The maximum calculated magnetic field level for the existing NYSEG Line 911 Willis Rd to Chateaugay 115kV transmission line is 63.82 mG located at the centerline of the existing ROW. The maximum calculated magnetic field level at the edge of the existing ROW is 8.77 mG. The maximum calculated magnetic field level on the proposed loop in loop out transmission connection is 97.11 mG located 50 feet from the centerline of the proposed ROW. The study reveals that the calculated magnetic field level at the edge of the proposed right-of-way, located 120.5 feet from the centerline, is 15.94 mG, well below the 200 mG maximum field level permitted at the edge of a transmission right-of-way in New York occupied by a major transmission line as per the NYS PSC Interim Guideline.

This report demonstrates that the EMF levels associated with the proposed loop in loop out transmission connection between the proposed NYSEG substation and the existing NYSEG Line 911 Willis Rd to Chateaugay 115kV line are within established guidelines. The nearest residence to the interconnection is approximately 950 feet away and the EMF levels from the interconnection will be negligible at this distance. Additionally, the solar panels installed as part of the Facility will be a minimum of 15 feet from the Facility Site boundaries. EMF from individual panels represent outputs consistent with household EMF levels. The setback associated with the Facility design contribute to minimize static EMF from these DC sources at the Facility Site boundaries.

---
